

GAITNDD recordings
64 subjects, 15,160 strides

plausibility screen and
subject-wise robust filter

63 subjects, 13,765 strides,
14 timing features

Source pool
one disease cohort (PD, HD, or ALS)
+ Control A (8 subjects)

$\text{Control A} \cap \text{Control B} = \emptyset$

Target pool
a different disease cohort
+ Control B (8 subjects)

Subject-level leave-one-subject-out
with grouped inner selection,
then one refit on the full source pool

Apply the fitted model unchanged:
no target labels, no retuning,
no target-side calibration
